

ABSTRACT OF THE DISCLOSURE

A device for supporting a tensioning device in a wall-to-wall carpet for the purpose of balancing of sideways joining patterns of carpet tracks to a uniform pattern picture includes a planar plate (1), wherein the planar plate (1) is furnished on the bottom side with a plurality of parallel strips (3) and with the nails (4) disposed in a row in the parallel strips (3). A swivelable counter support (6,7) is arrestable at an arbitrary position of the plate 1 and provided for a connection rod (8) extending cross over the plate upper side toward a further shift plate (9) furnished at the bottom with nails and pressable away from the plate (1) held in the carpet floor by way of nails (4) by way of a toggle joint mechanism (13). A carpet track can therewith be stretched until a correct pattern picture is reached over the complete surface.
